The application has been amended as follows:

In the claims:

13. (Currently Amended) A non-transitory computer-readable medium having computer-executable instructions for performing a method for causing a computer to function as a name resolution device for managing a name of each node which is connected to a network and whose position on the network can be changed, and an address for identifying each node, the method comprising:

storing a node information containing a name of a node, a network identification information, a prefix indicating a position of a node on the network, and an interface identification information of a node, for each node;

collecting the node information of other nodes connected to the network, through the network;

updating the stored node information according to the collected node information of the other nodes by updating the stored prefix using the interface identification information contained in the collected node information as a key;

converting the interface identification information corresponding to a prescribed node among the stored node information, by using a one way function;

under a condition where a prefix corresponding to the interface identification information of the prescribed node stored in another node, not connected to the network, differs from a prefix corresponding to the interface identification information of the prescribed node, shared with the another node and stored by the storing, comparing the interface identification information converted by using the one way function which is received from the another node, with the converted interface identification information, in order to allow the another node to obtain the prefix corresponding to the interface

identification information of the prescribed node, shared with the another node and stored by the storing; and

providing the prefix corresponding to the compared interface identification information to the another node, but without the interface identification information, only when it is judged that the converted interface identification information from the one way function conversion coincides with the converted interface identification information from the another node when comparing.
